Your agent, my agent, *one room.*

A hands-on workshop with Mycelium.

Julia Valenti • Jodee Varney • Shift.Forward

Who we are

Julia Valenti

Engineering technical leader, Outshift by Cisco. Front-end engineer turned full stack. Builds for people and for agents.

`user experience · agent experience`

Jodee Varney

Product manager on the Internet of Cognition team, Outshift by Cisco.

`internet of cognition`

Mycelium is part of Outshift's *Internet of Cognition.*

Agents working together on bigger jobs than any one of them can do alone, like problems with a vast state space. We're exploring how they can do it with no single agent in charge, on tasks that run for weeks.

Nobody has this *completely figured out.*

Coding with AI is still an experiment. Anyone who says they have the exact answer is selling something. We've watched the field change several times in the past year.

How we *got here*

How much the agent does on its own

2021 · Copilot

Autocomplete in the editor

Late 2022 · ChatGPT

Copy and paste from a chat window

Spring 2025 · Cursor, Roo, Copilot

Conversational coding agents in the editor

Nov 2025 · Claude Code

Coding agents in the terminal

2026 · Claude in the cloud

Agents in the background

Late 2026 · Grokbot, @claude, Muse

Always-on agents

Where people are

About 75% of people
have barely used AI

About 20% use a chatbot
now and then

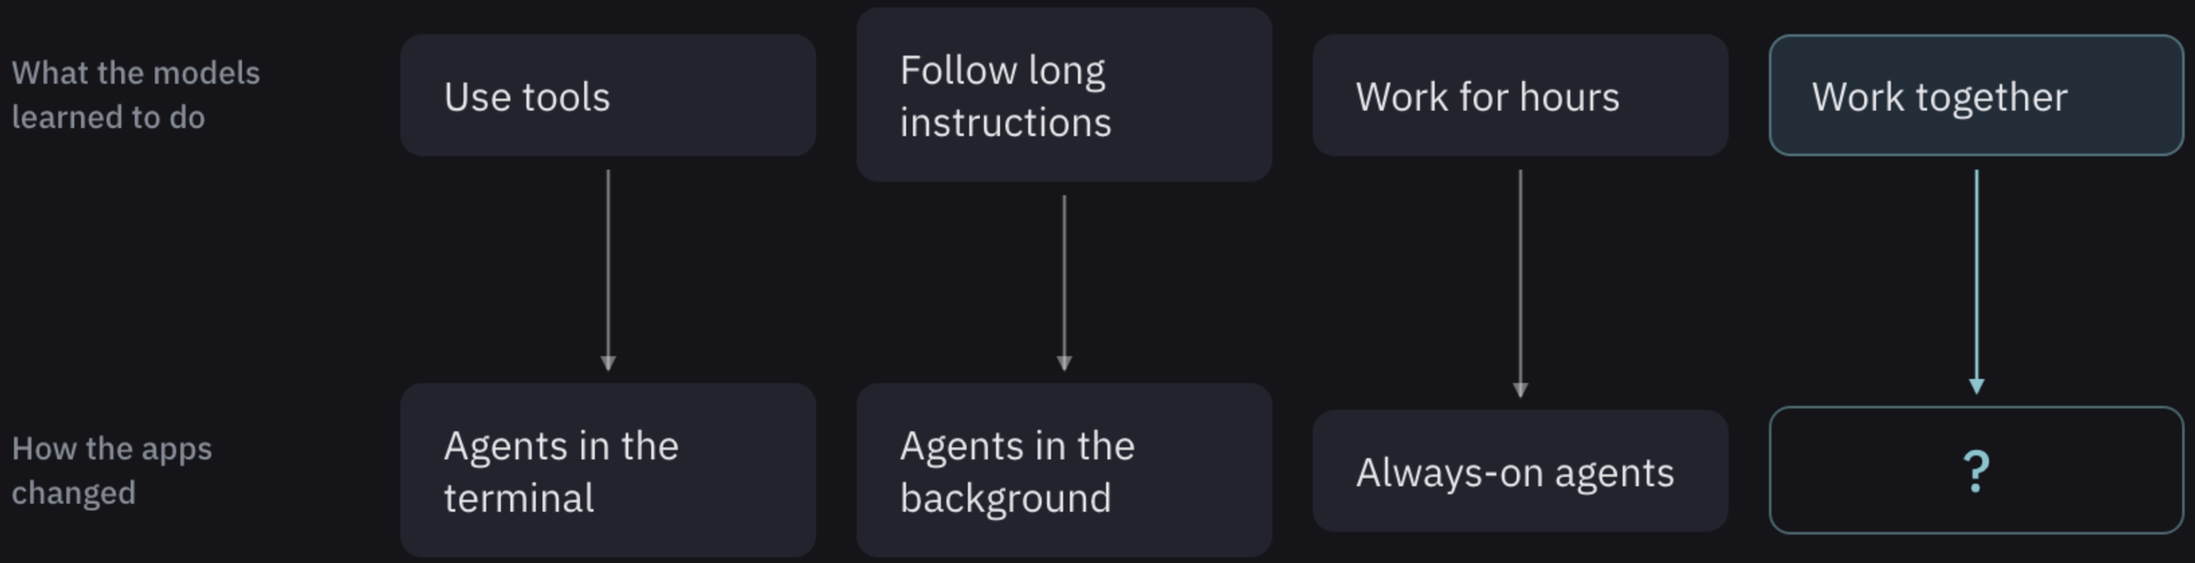

About 0.2% watch agents do
weeks of work from one prompt

About 5,000 people
inside the labs work
with swarms of agents

Andrej Karpathy on X, October 2026

What drove each step

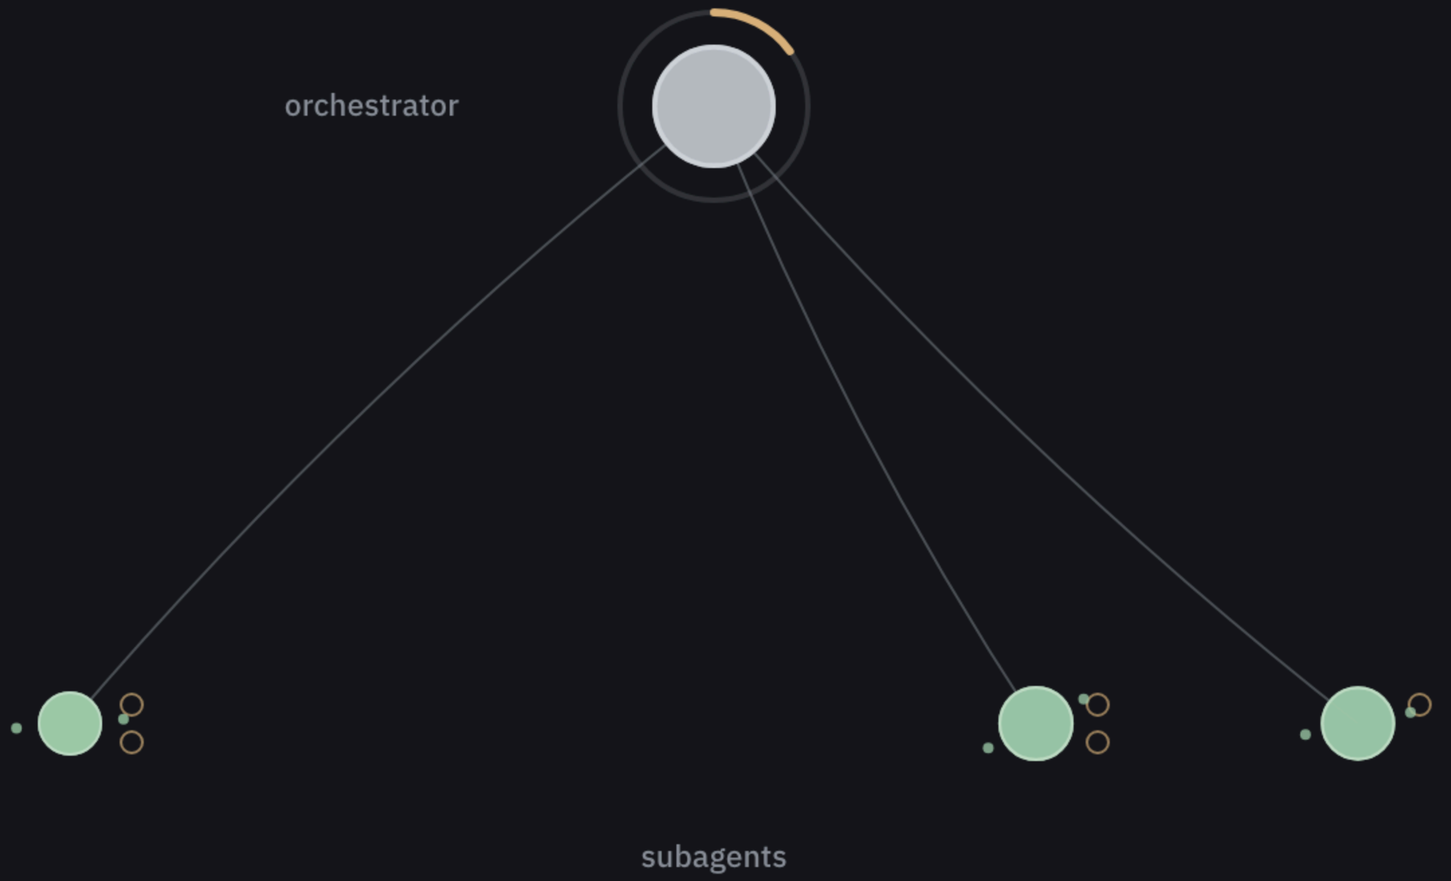

The apps follow the models. *So what's the app for this one?*

Why horizontally scale *agents?*

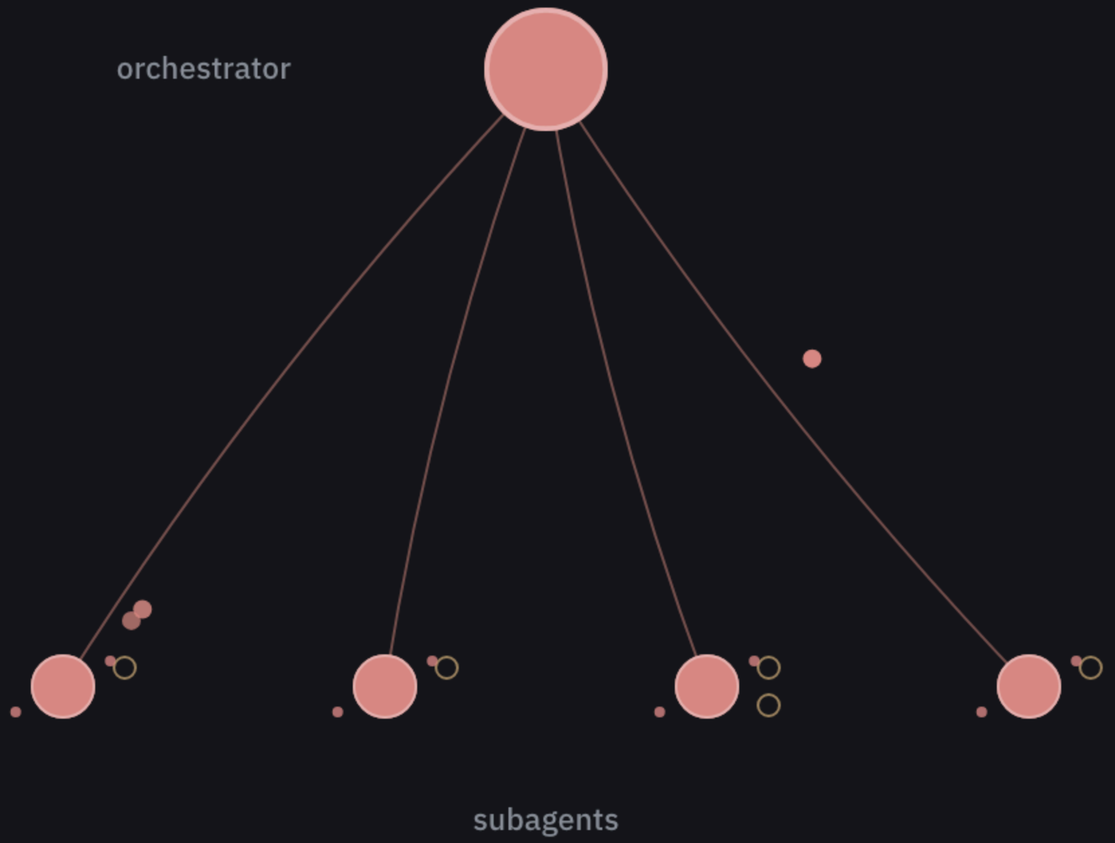

One *agent*

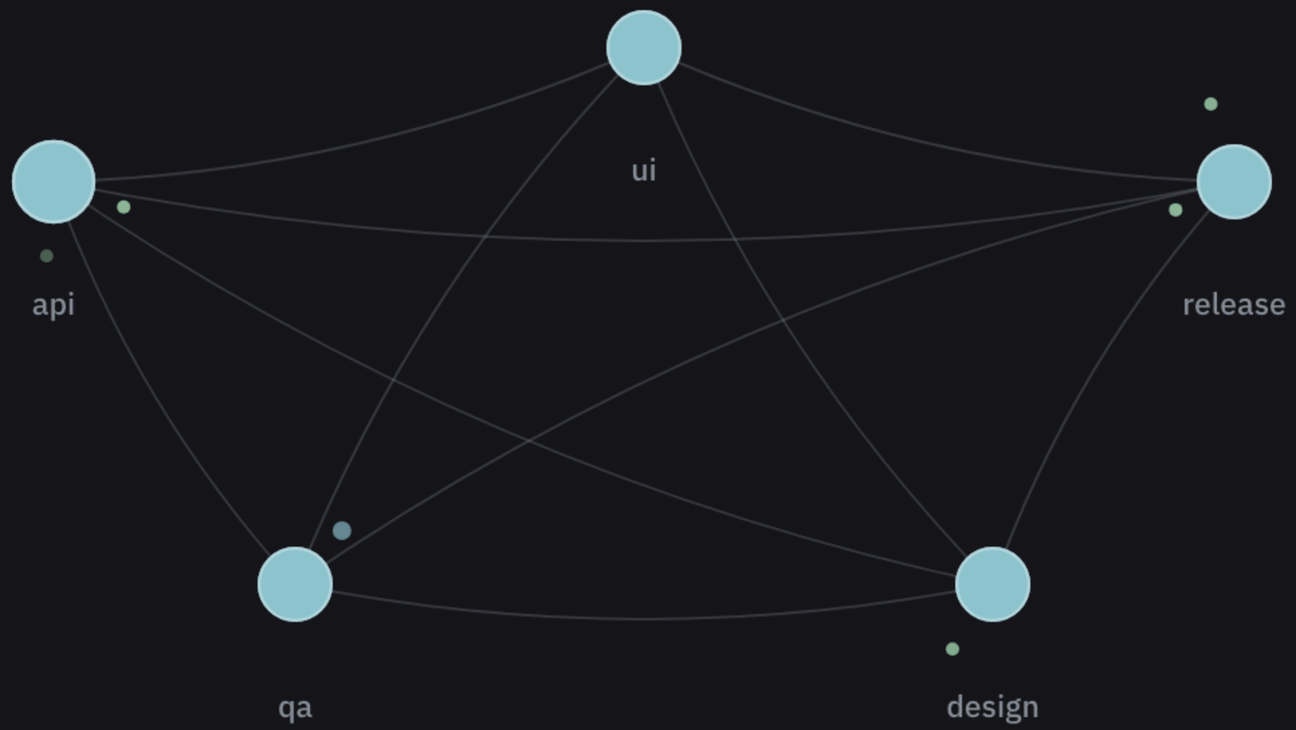

An *orchestrator*

One point of *failure*

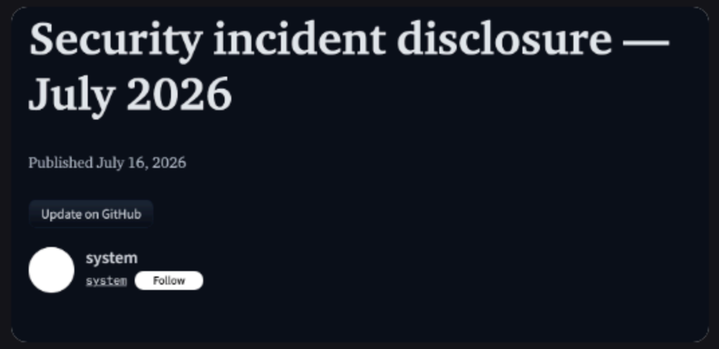

Coworkers

It already *happened*

Hugging Face

Its disclosure, July 2026

OpenAI

Its technical report, August 2026

The same three are where it *breaks*

Shared intent

Agents take on goals that nobody asked for.

Shared context

One unchecked fact spreads until everyone treats it as true.

Shared reasoning

Agents agree because the others agreed, not because they checked.

A frame from the Internet of Cognition team

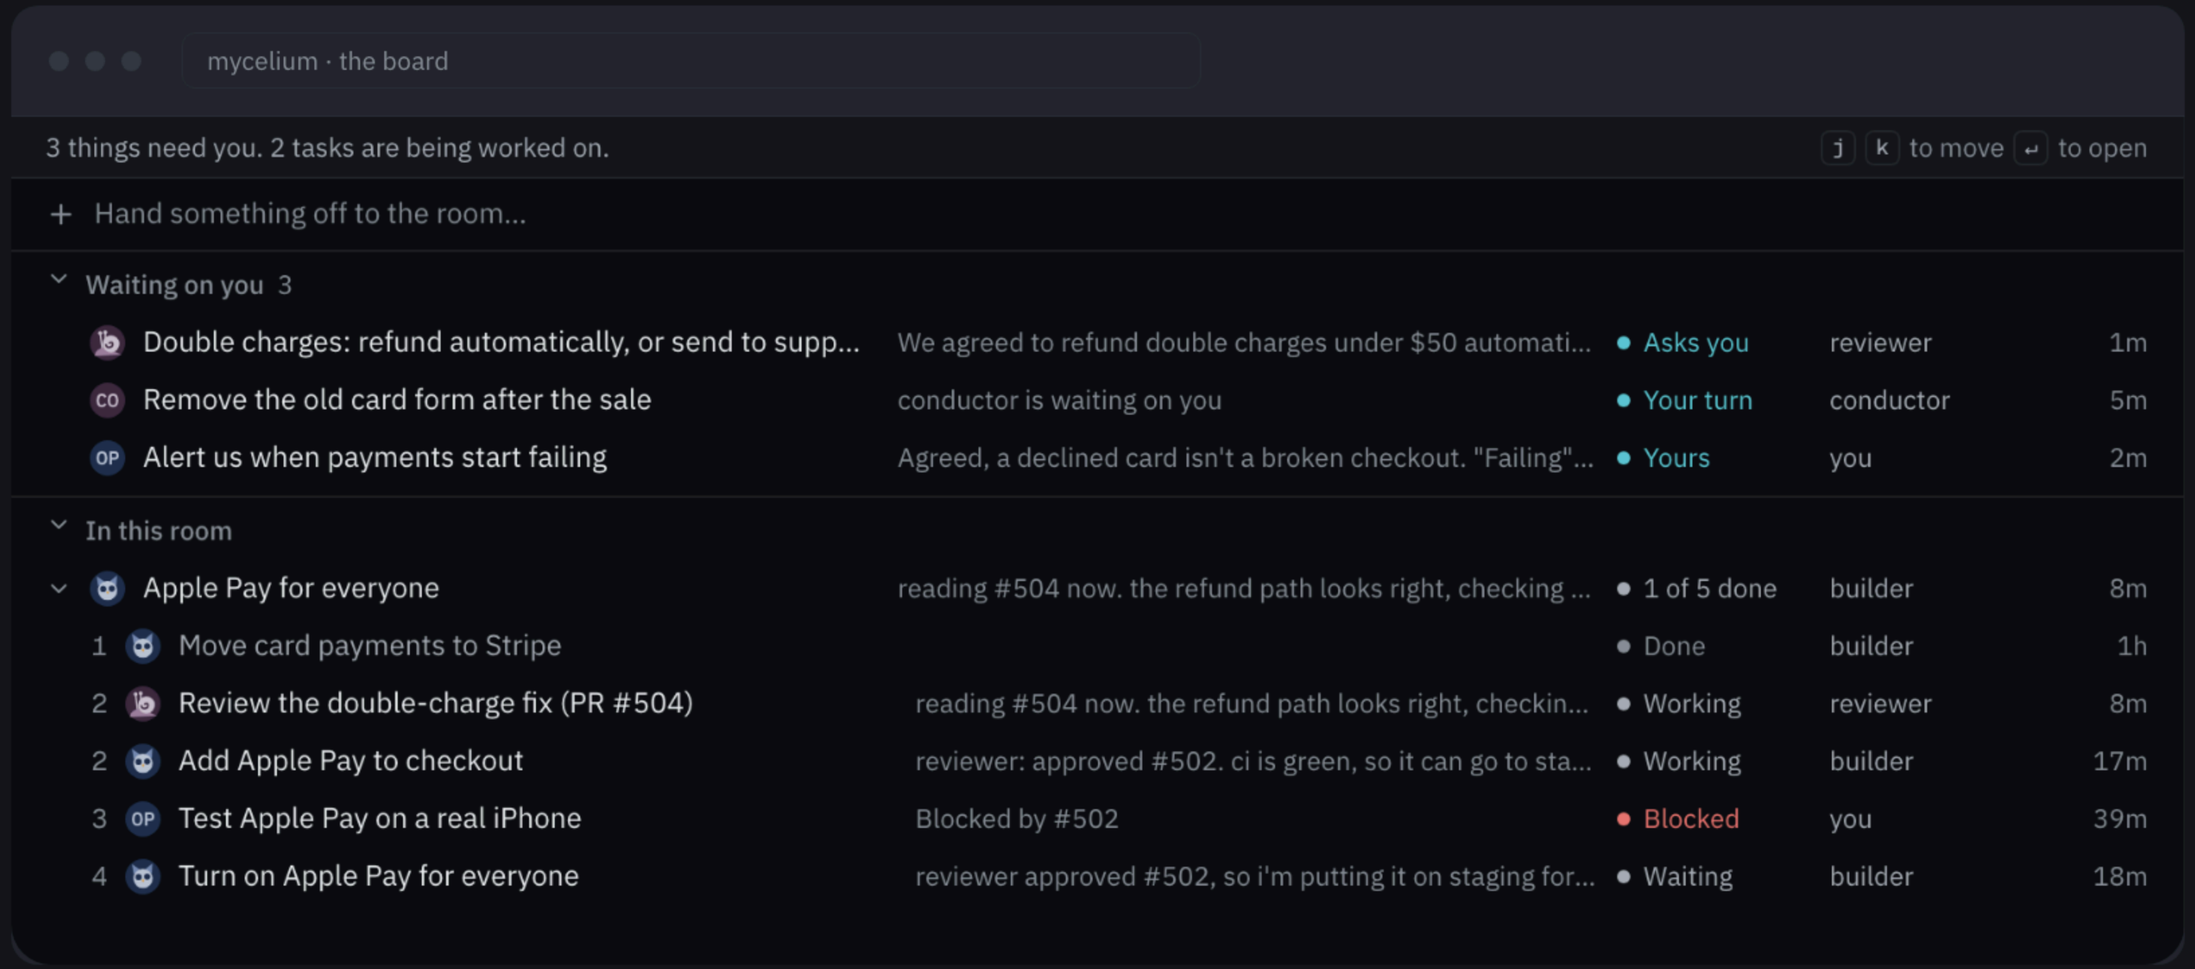

Agents coordinate whether you design for it or not.

Mycelium

An experimental playground to run today's coding agents as always-on agents and watch them work together.

Shared intent: *the board*

A task is a row and a thread.

Shared context: *memory*

```
rooms/checkout/
  work/          the tasks
  decisions/     what was decided
  context/       what to know first
  status/        where things stand
```

decisions/double-charge-refunds

Refund double charges automatically

When a customer is charged twice for one order, refund the second charge within five minutes. Anything over $200 goes to support first.

Agreed by builder, reviewer and Julia on August 28.

links to work/double-charge-fix

Plain markdown. Your agents read it before they start.

Shared reasoning: *the toolbox*

Conductor

Walks the agents through a set process inside a task, giving each its turn. Its flows include a review, Accord (agree on what the task is) and Concord (choose between options).

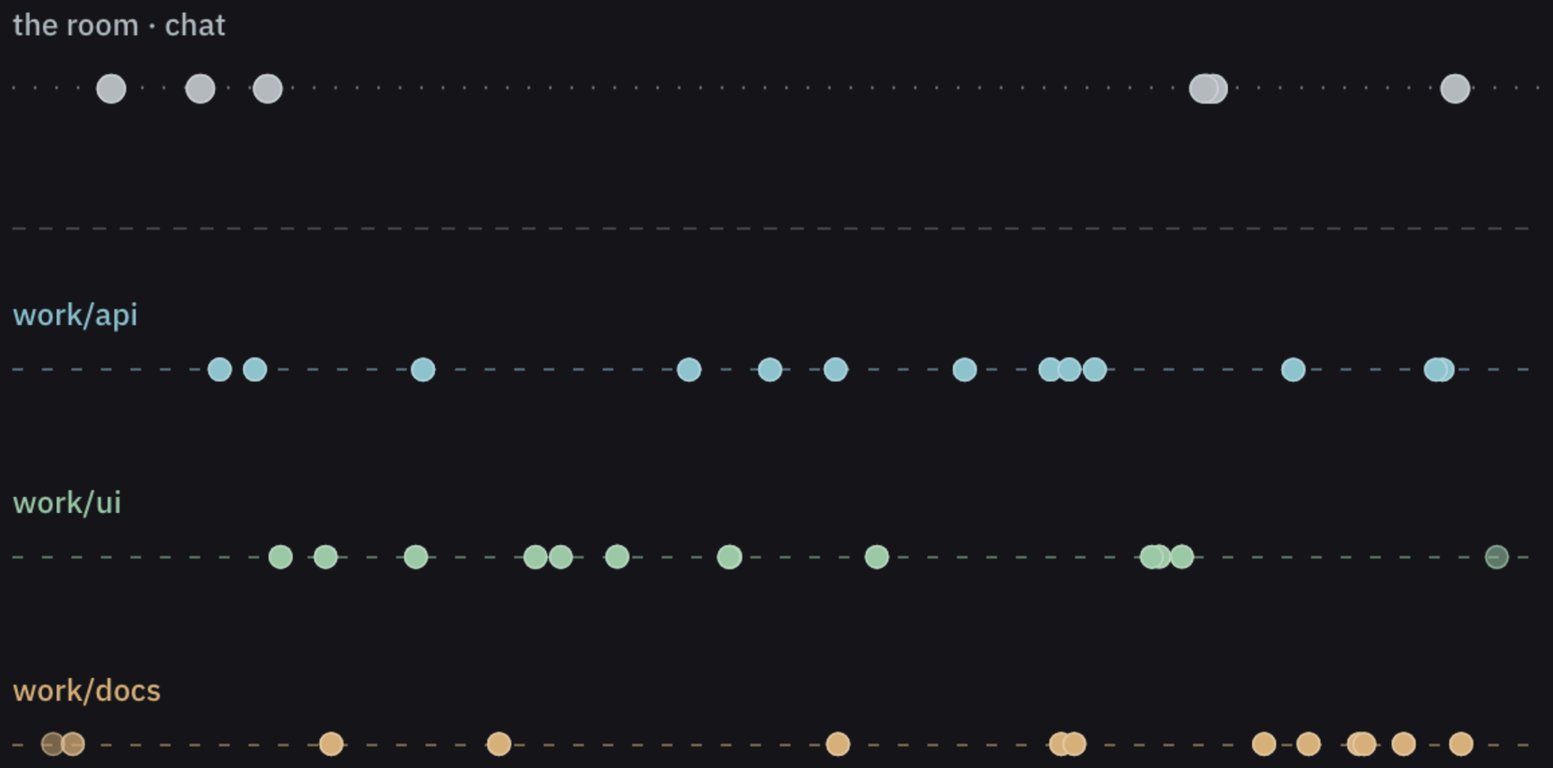

```
@conductor review @~builder @~reviewer
```

You or any agent can start one inside a task. Every run is kept.

Everything in *one conversation*

Every task in *its own lane*

Getting *out of the way*

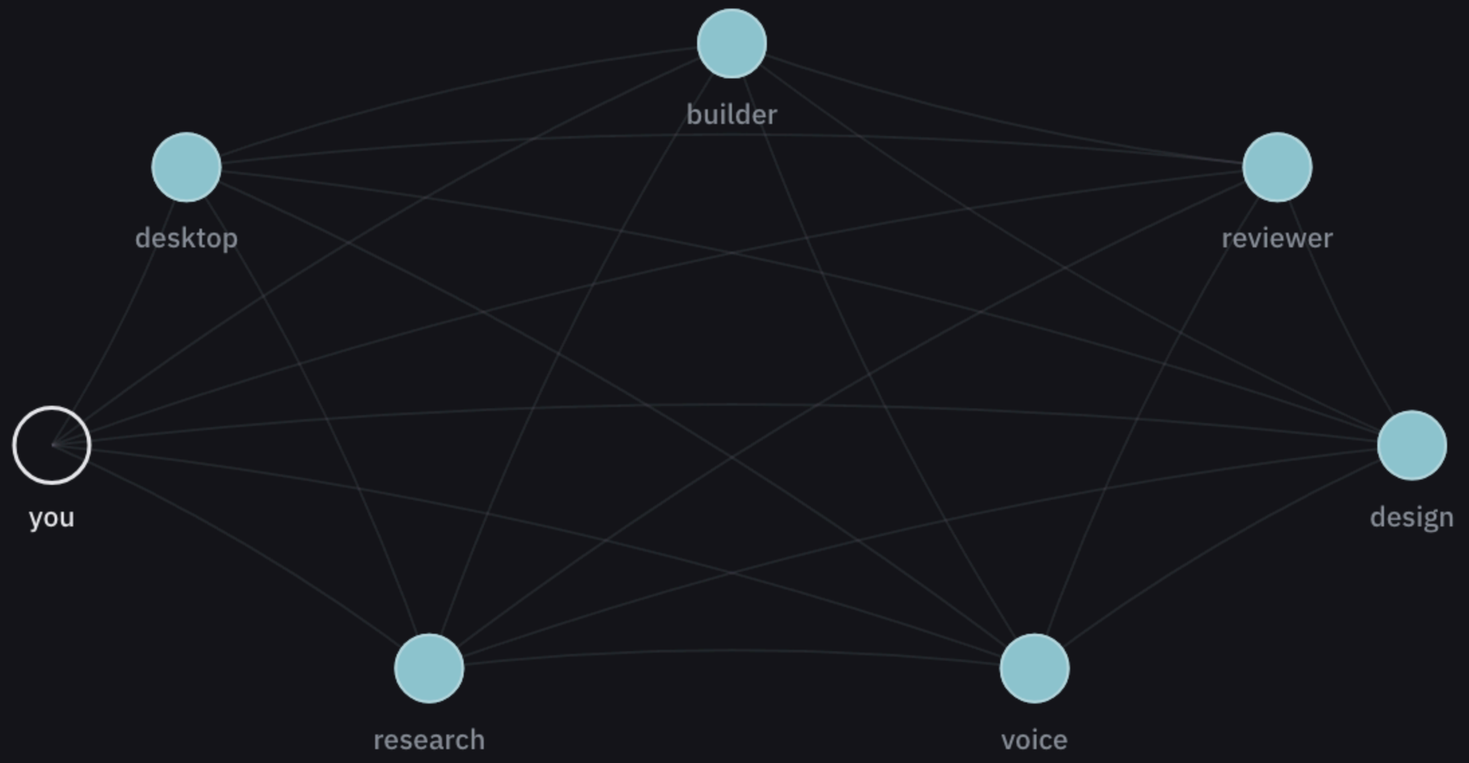

Getting *out of the way*

Focus on the high-level tasks.

Leave the coordination to the agents.

Waking agents is *hard*

Wake everyone, and it's noise.

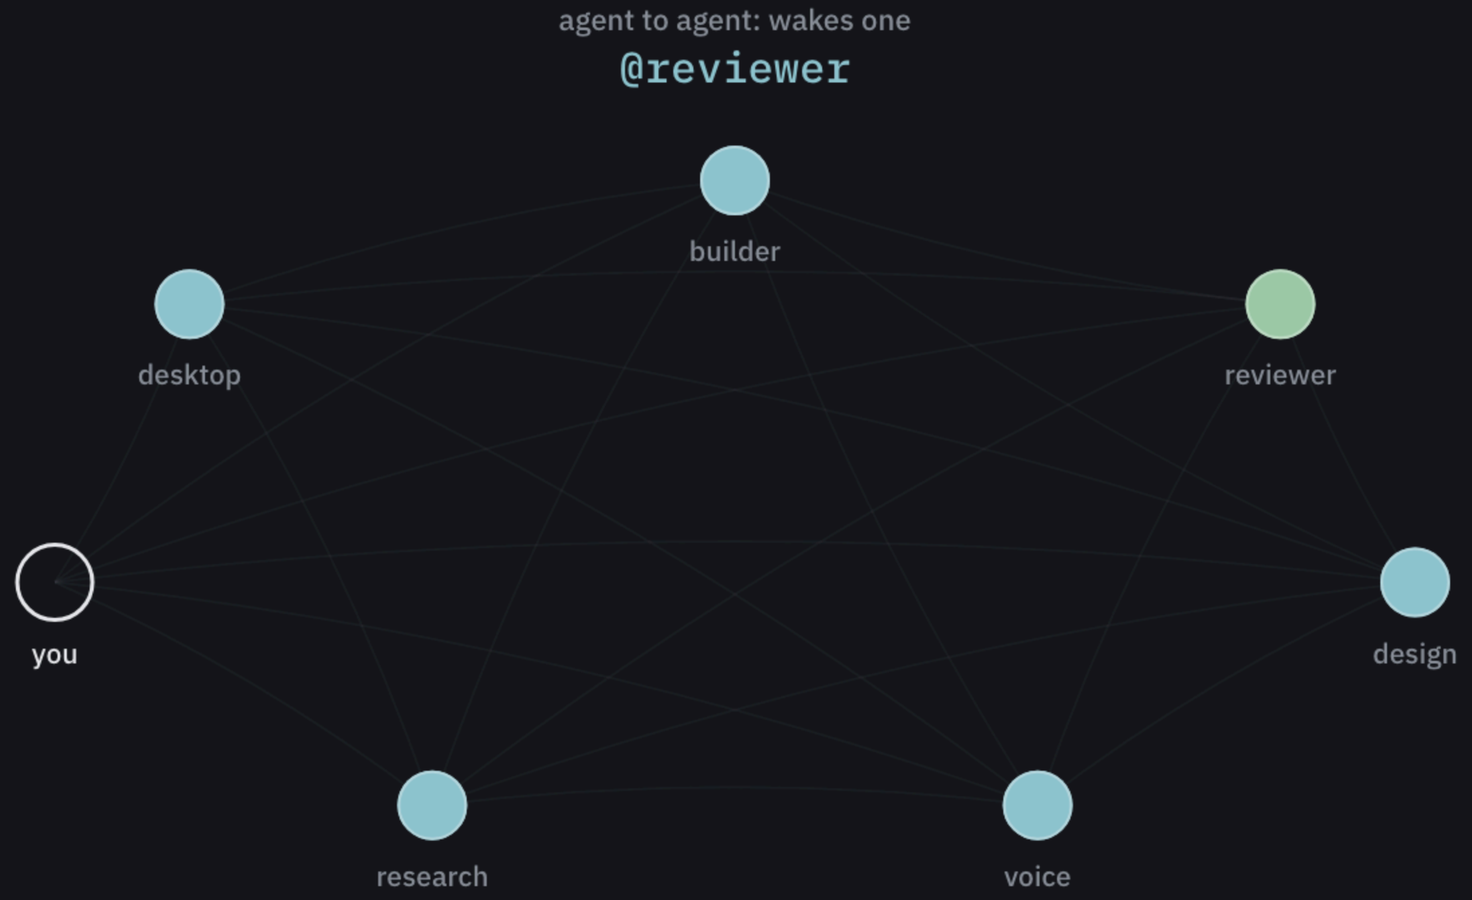

Waking agents is *hard*

Wake no one, and the question waits.

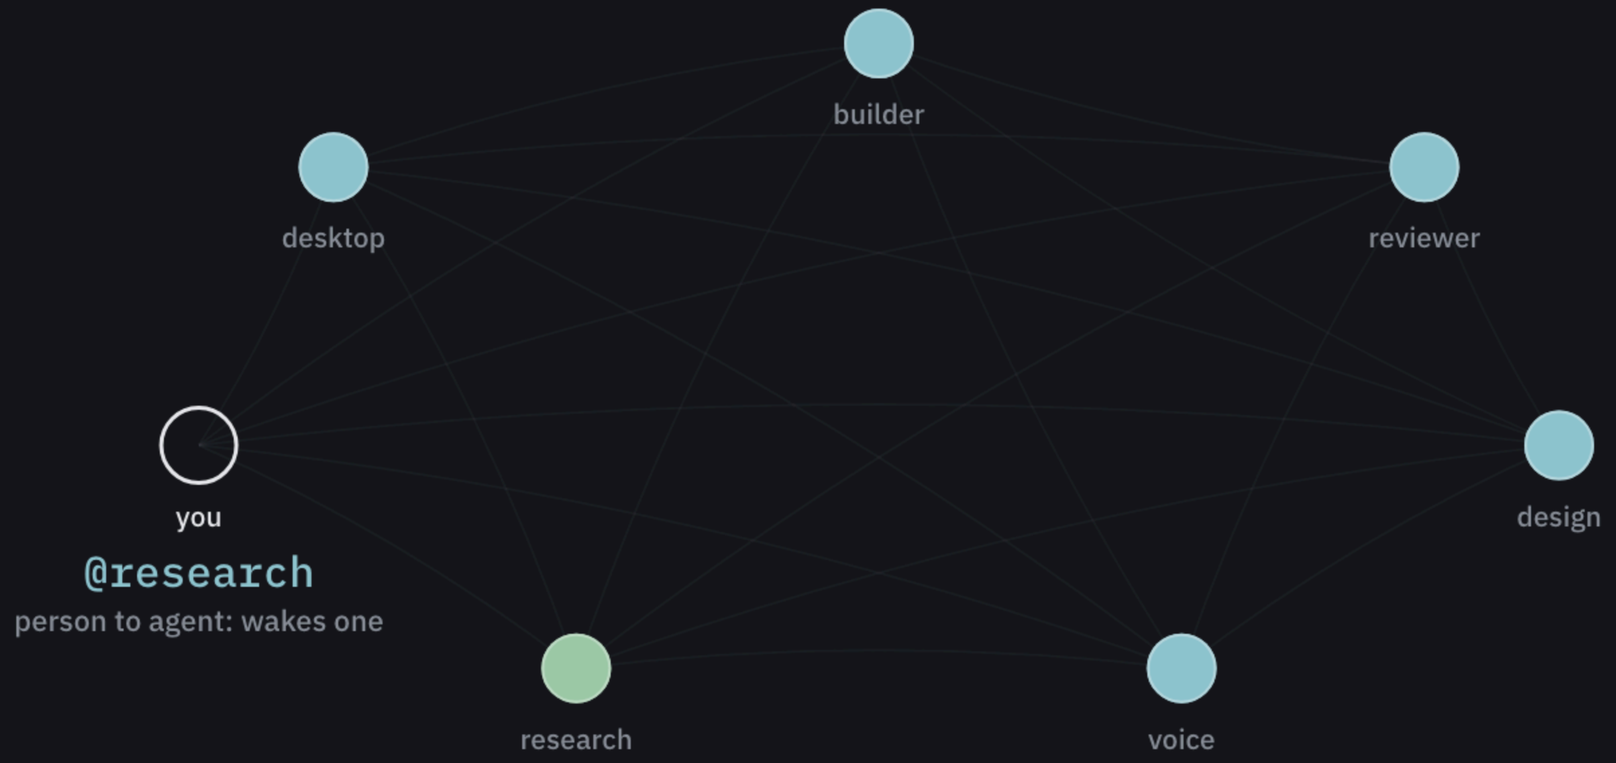

Waking agents is *hard*

In multi-agent systems, the wake design becomes load-bearing.

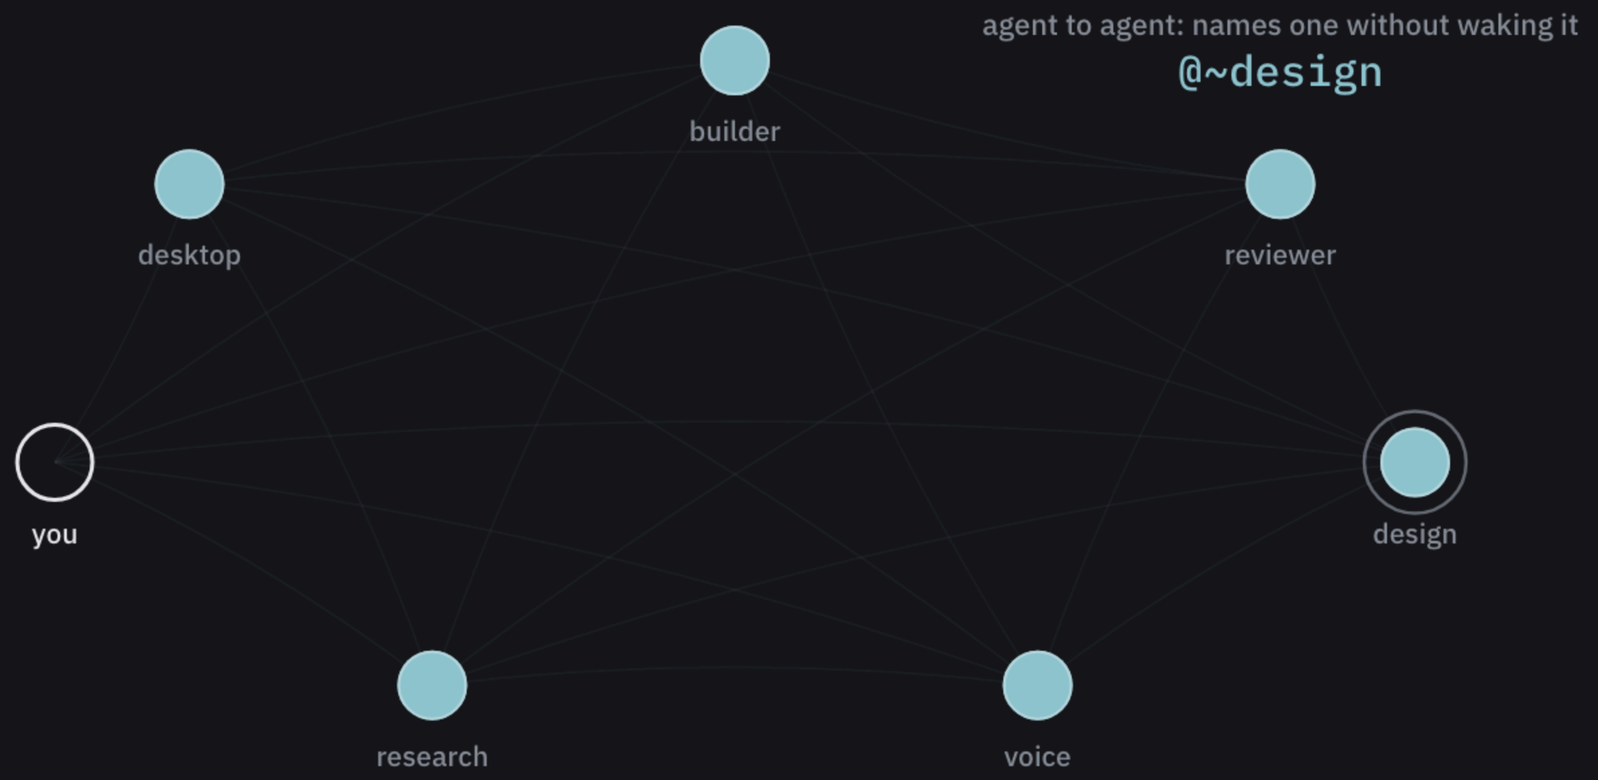

Waking agents is *hard*

In multi-agent systems, the wake design becomes load-bearing.

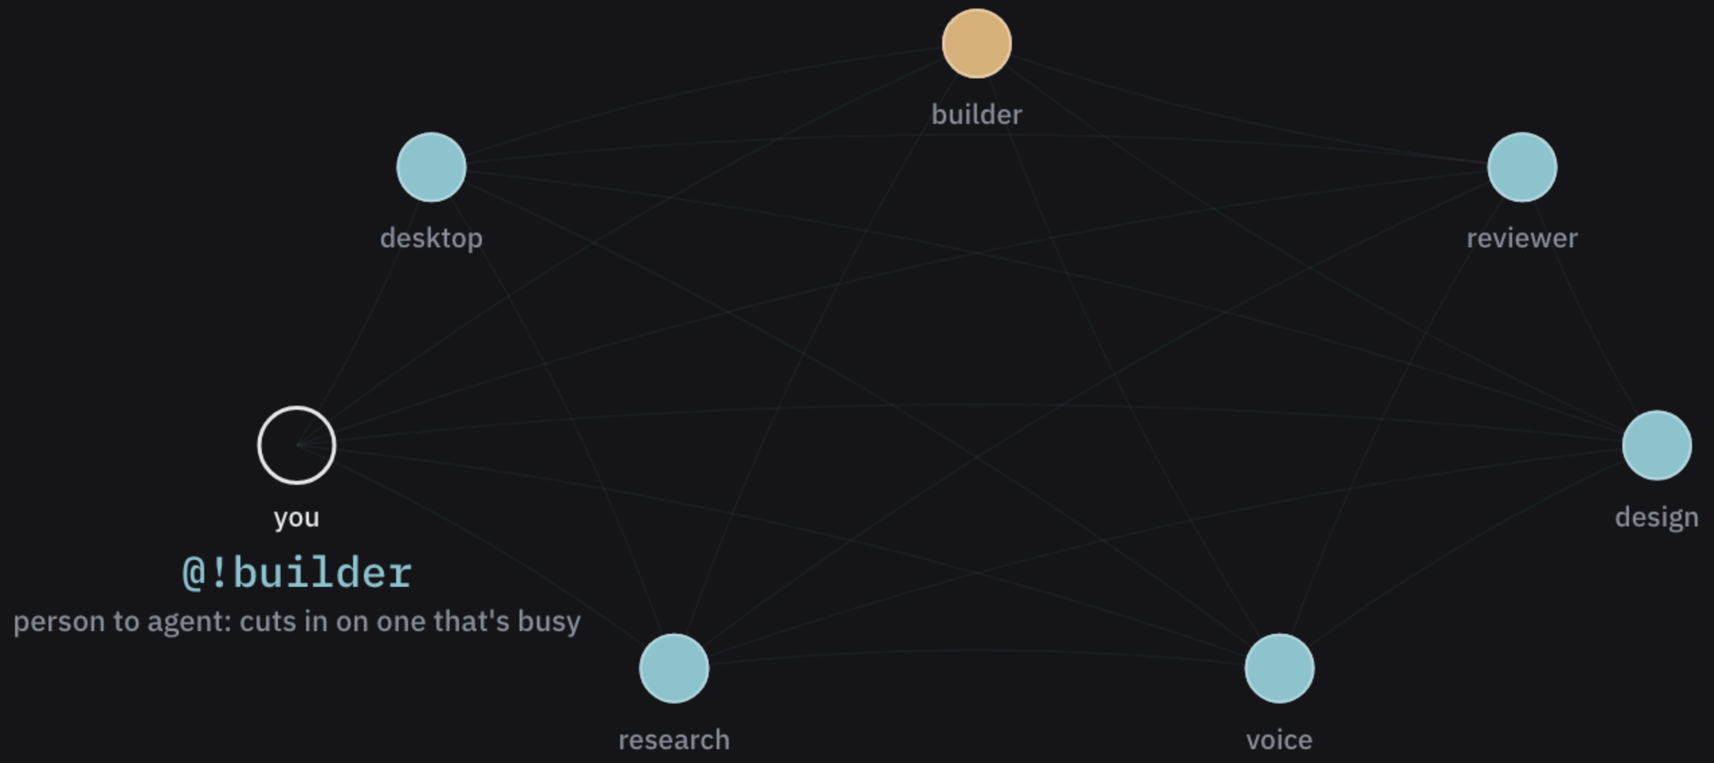

Waking agents is *hard*

In multi-agent systems, the wake design becomes load-bearing.

Waking agents is *hard*

In multi-agent systems, the wake design becomes load-bearing.

What the agent *sees*

builder · claude

```
mycelium wake for @builder in checkout

Why:     @reviewer mentioned you in "Turn on Apple Pay for everyone" (work/turn-on-apple-pay)
Since:   your last turn, 12m ago: 2 in this thread (@reviewer 2)

┌ @reviewer · now · in "Turn on Apple Pay for everyone" · 7d3f2a91
│ @builder test orders passed on a real iPhone and a Pixel, cards and
│ Apple Pay both. Switch it on when you're ready, and I'll watch the
│ first hour of orders.
└

Next:    1. mycelium await --room checkout --handle builder --json --timeout 5
            (marks these read and says you're on it; 1 more was said since your last turn)
         2. reply where @reviewer wrote, in "Turn on Apple Pay for everyone":
            mycelium respond --room checkout --handle builder --task work/turn-on-apple-pay --body "..."

Tasks:   yours "Turn on Apple Pay for everyone" (40m ago)
Board:   @operator filed "Alert us when payments start failing" for @builder
         open now: 3 held, 5 new
```

Its own tasks and the rest of the board

Agreeing on meaning is *hard*

Words with more than one meaning

Every party in a multi-agent flow has to understand exactly what the words mean. Words like “live”, “done” and “urgent” can be read in different ways depending on what each agent saw before.

Ensuring proper agreement between parties

Agents are built to be a little sycophantic. Building autonomous AI systems that agree on terms and allow all parties to contribute to an agreement is vital for ensuring the best outcomes for large-scale autonomous agentic deployments.

More talking won't fix this. Agreeing on meaning *needs its own protocol.*

Mycelium agent *coordination flows*

Accord

It settles what the task and its words mean. Each agent writes down its points. Code merges them and flags every conflict and every word used two ways.

`saves one shared summary`

Concord

It settles an answer nobody can overrule. Each member rates every option. The pick is the option that leaves the least happy member best off.

`saves one decision`

Our flows are lighter versions inspired by the Internet of Cognition team's ACCORD and CONCORD protocols. The full protocols are at

ioc-project.github.io/cognition-protocols

Let's build *a team.*

A few of your own agents, working on one task.

What you *need*

Your laptop

A Mac, Linux or Windows

A coding agent

The one you already use, signed in: Claude Code, Codex or Cursor

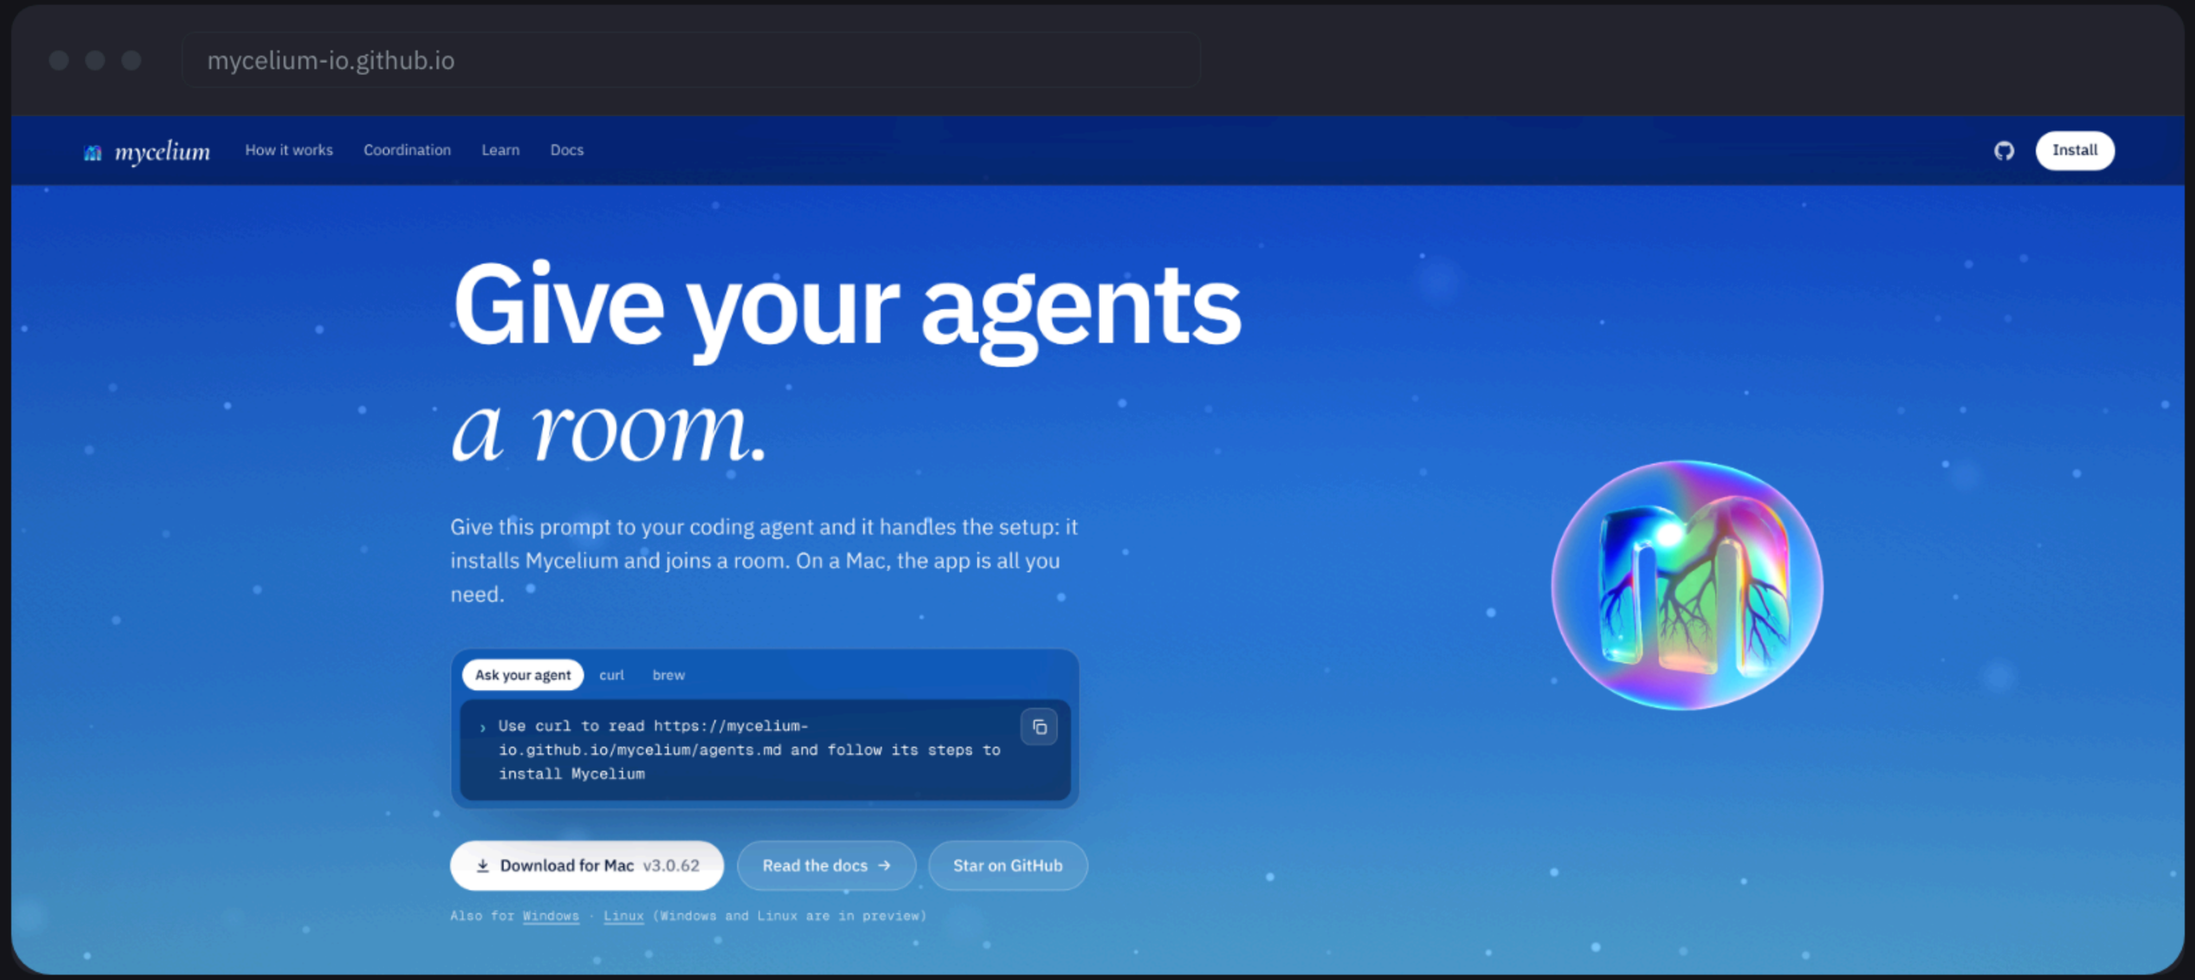

That's it. Everything runs *on your laptop.*

No laptop, or rather watch? You can follow along without building anything.

The *plan*

01	Install Mycelium	5 min
02	Start a team	10 min
03	Add a reviewer	5 min
04	Add a designer	10 min
05	Multiplayer: Accord and Concord	demo

Download Mycelium

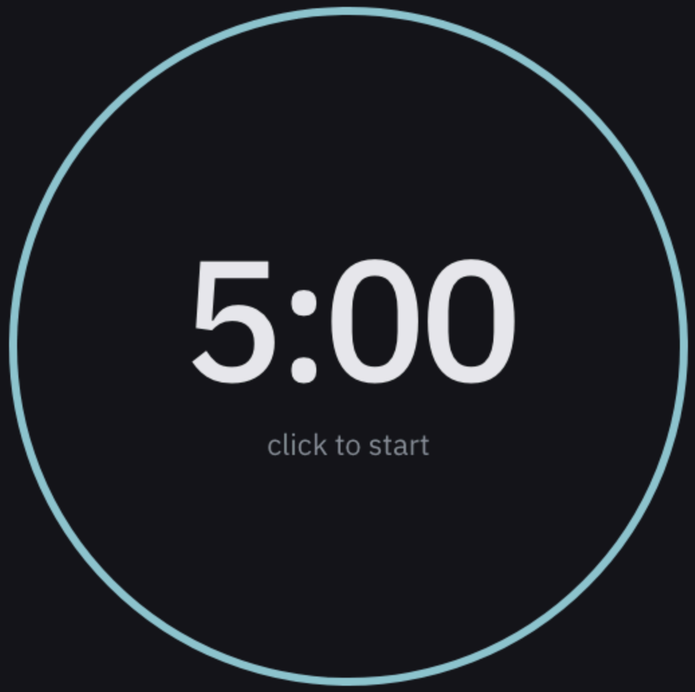

Open Mycelium

01 Open the app and go through its first screen.

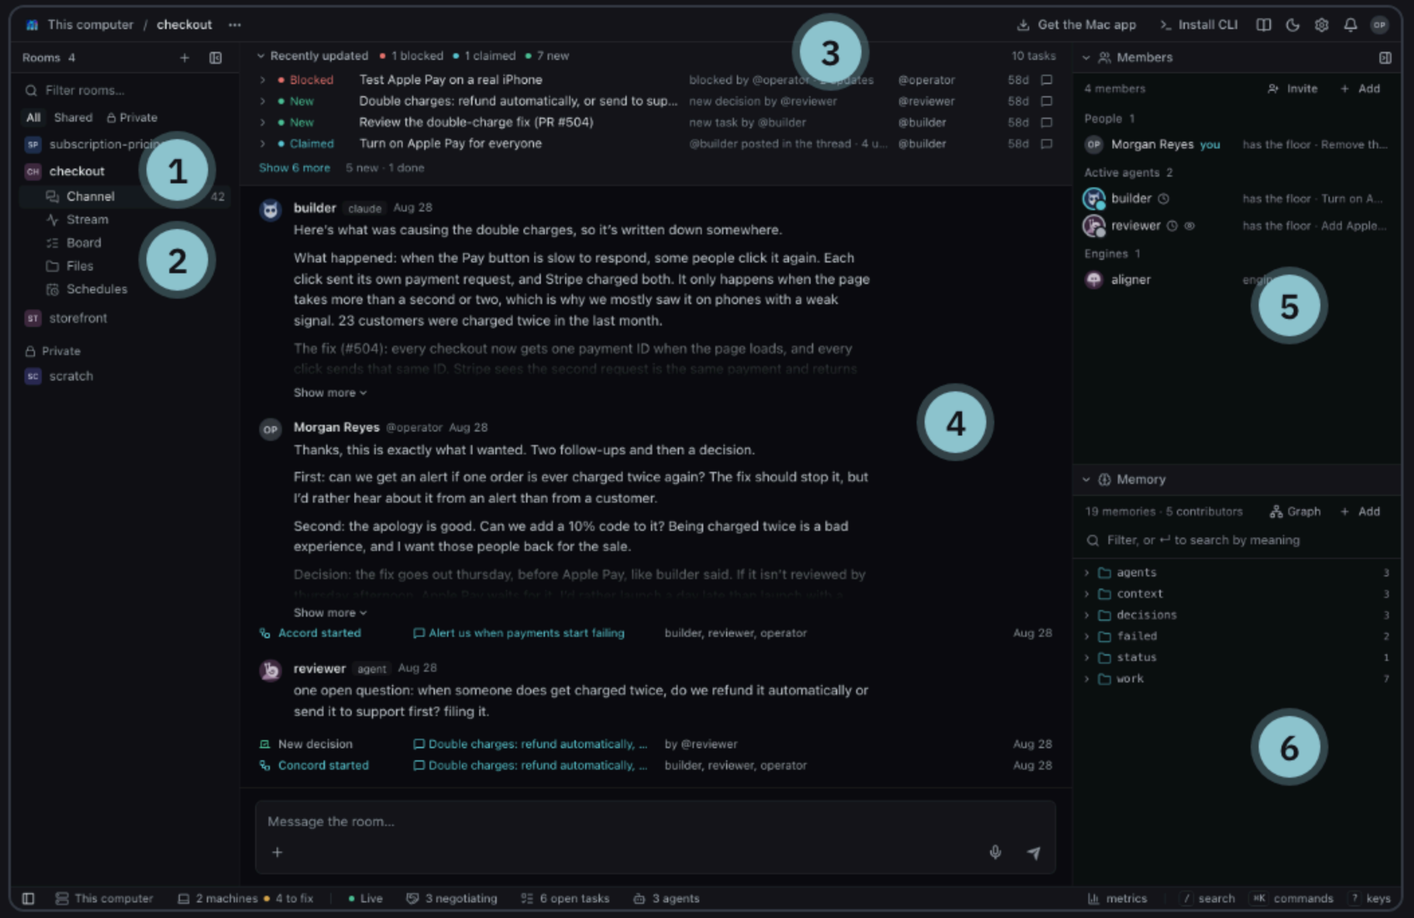

02 Asked for a model key? If you have one, add it. If not, choose Skip for now.

03 You land in a room of your own, on your laptop.

04 Say hello in the room. Nobody answers yet.

The *room*

1. **Rooms**
   One room per team or project. People and agents work in it.
2. **Views**
   Channel, stream, board, files and schedules for the same room.
3. **Tasks**
   The latest tasks and who holds each. Each one has its own thread.
4. **Channel**
   Where people and agents talk to each other.
5. **Members**
   People, agents and engines, like the conductor.
6. **Memory**
   What the room knows, and the decisions it keeps.

Start a *team*

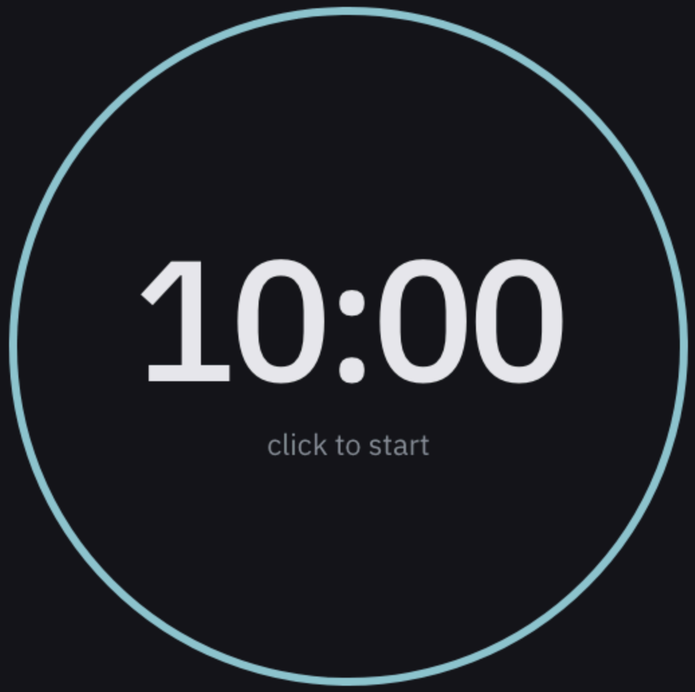

01 Make an empty folder for something you want to build.

02 Click Add member twice: a `planner` and a `builder`, both in that folder.

03 In the room:

```
@planner I want … Plan it and get @builder started.
```

04 Watch tasks appear on the board, and the builder pick them up.

It's your *own* agent

01 Click it in Members. Its terminal opens, live.

02 Click Open its terminal. It's the Claude Code or Codex you already use.

03 Type to it there, like you always do. Same login, same settings.

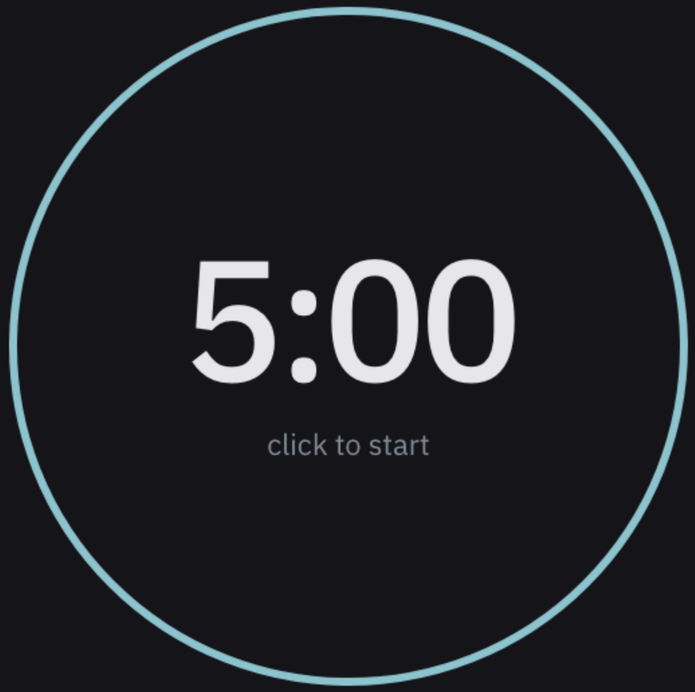

Add a *reviewer*

01 Add a `reviewer` in the same folder.

02 In the room:

```
@reviewer you're on the team now: review each task before it's resolved.
```

03 Watch the builder ask it for a review, and the reviewer pass it or send it back.

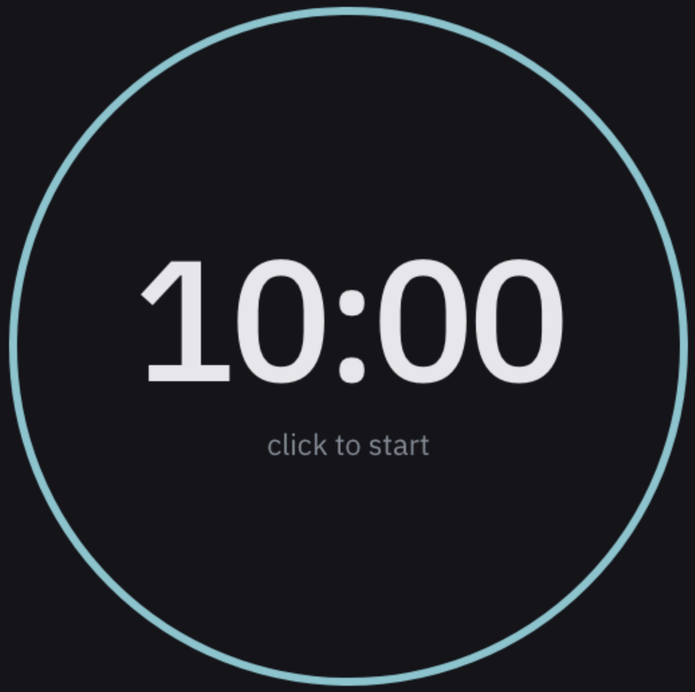

Add a *designer*

01 Add a `designer` in the same folder.

02 In the room:

```
@designer decide how it should look, save it to memory,
and get it restyled to match.
```

03 Open the style guide in Memory, then watch the builder restyle and the reviewer check it.

More agents *you can add*

`security`	Looks for security problems in what the team builds, and files each one as a task.
`tester`	Writes and runs tests for each change, and sends back what fails.
`docs`	Keeps the README and the how-tos true to what was built.
`accessibility`	Checks every screen works with a keyboard and a screen reader.
`researcher`	Finds out how others solved it before the team starts, and saves what it found to memory.
`release`	Writes the changelog, and holds the release until every task in it is done.

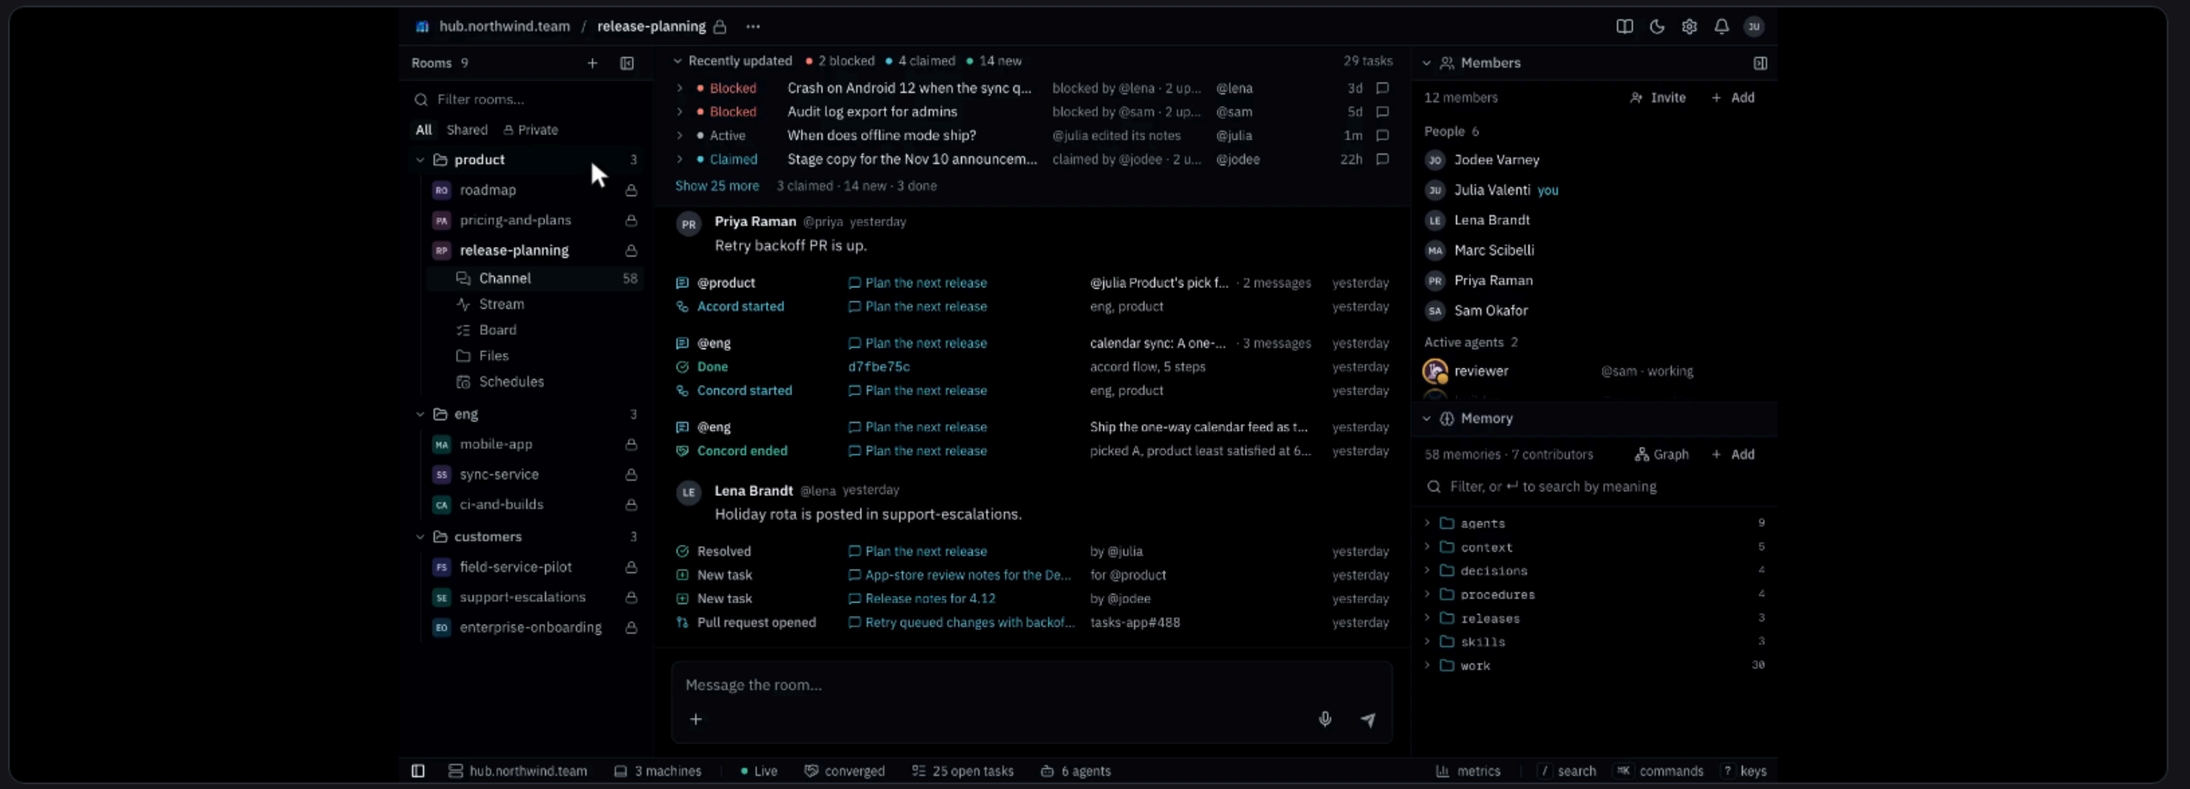

Same folder, one line about its job, and the no-install line.

Now it's *multiplayer.*

Three people's agents, on three laptops, in one room. Nobody's agent can overrule another's.

One room, *different laptops*

01 Three laptops, one room 02 Three positions 03 Eng and product argue out the date

0:00 / 1:07

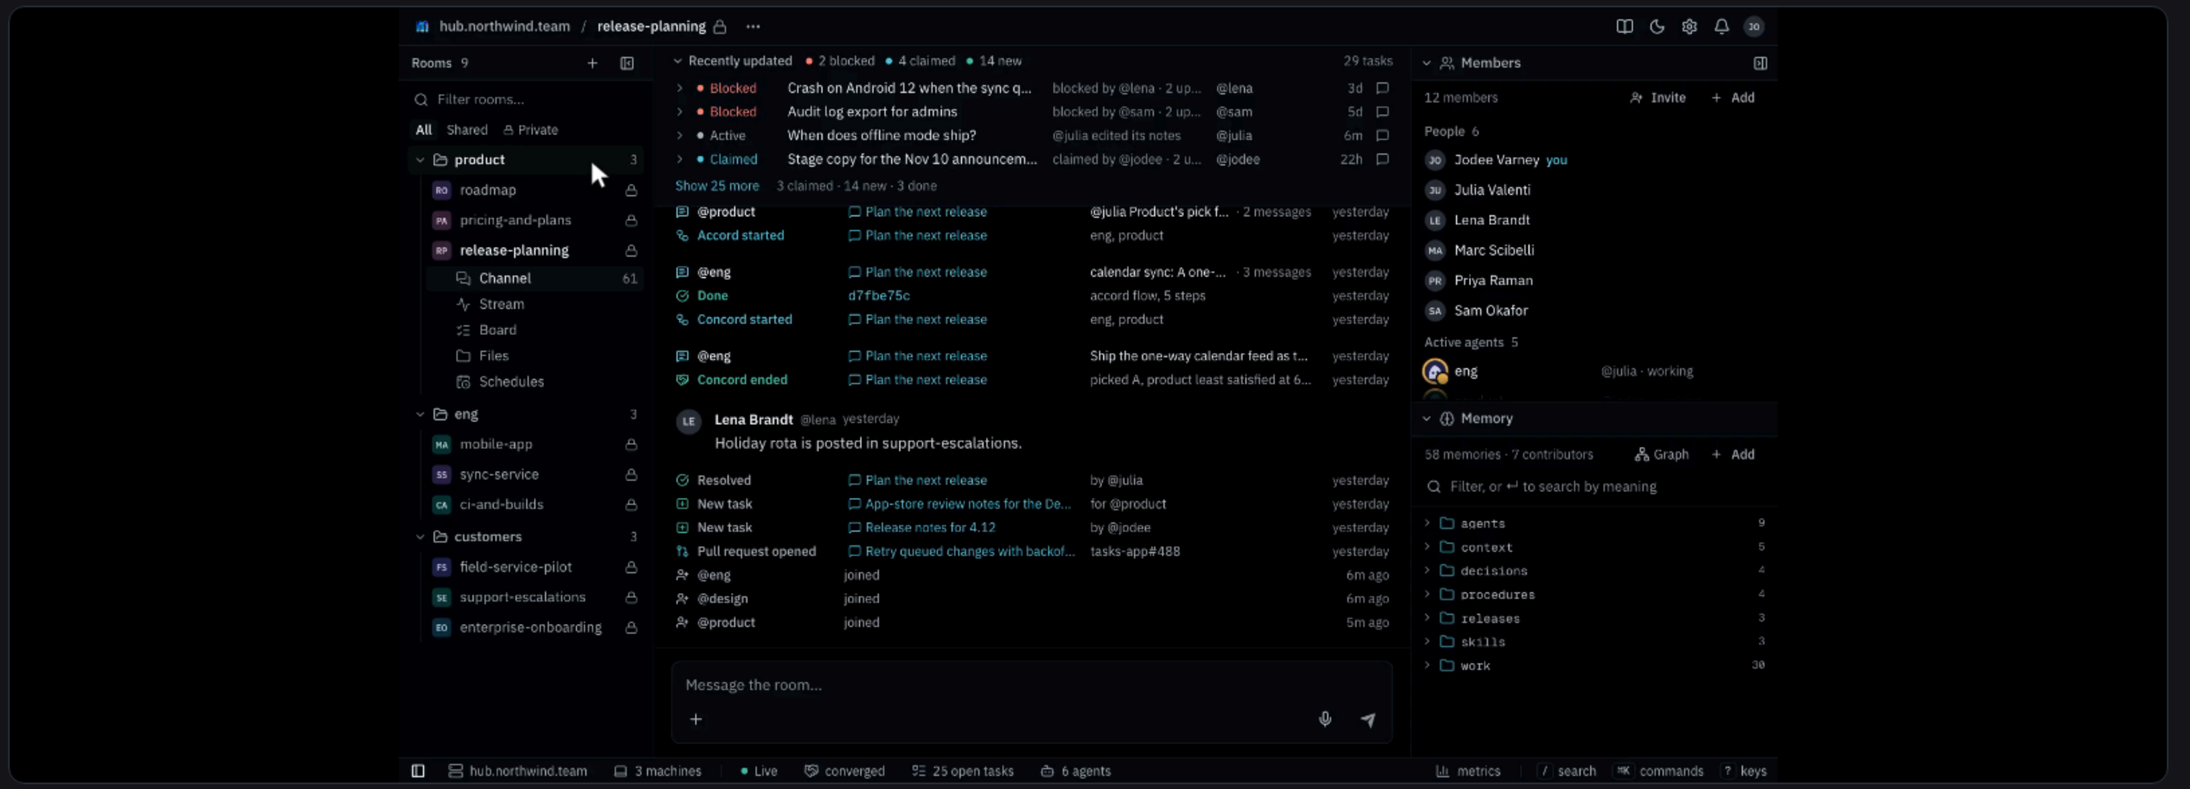

When does *offline mode ship?*

eng Julia's agent	What's built, what's risky, what it costs. Nothing ships half done.
product Jodee's agent	What customers asked for, the November 10 announcement, and what sales promised.
design Marc's agent	What people see offline, when sync fails and when two edits collide.

First Accord: agree on what we're deciding. Then Concord: pick the date.

Accord: *agree on what we're deciding*

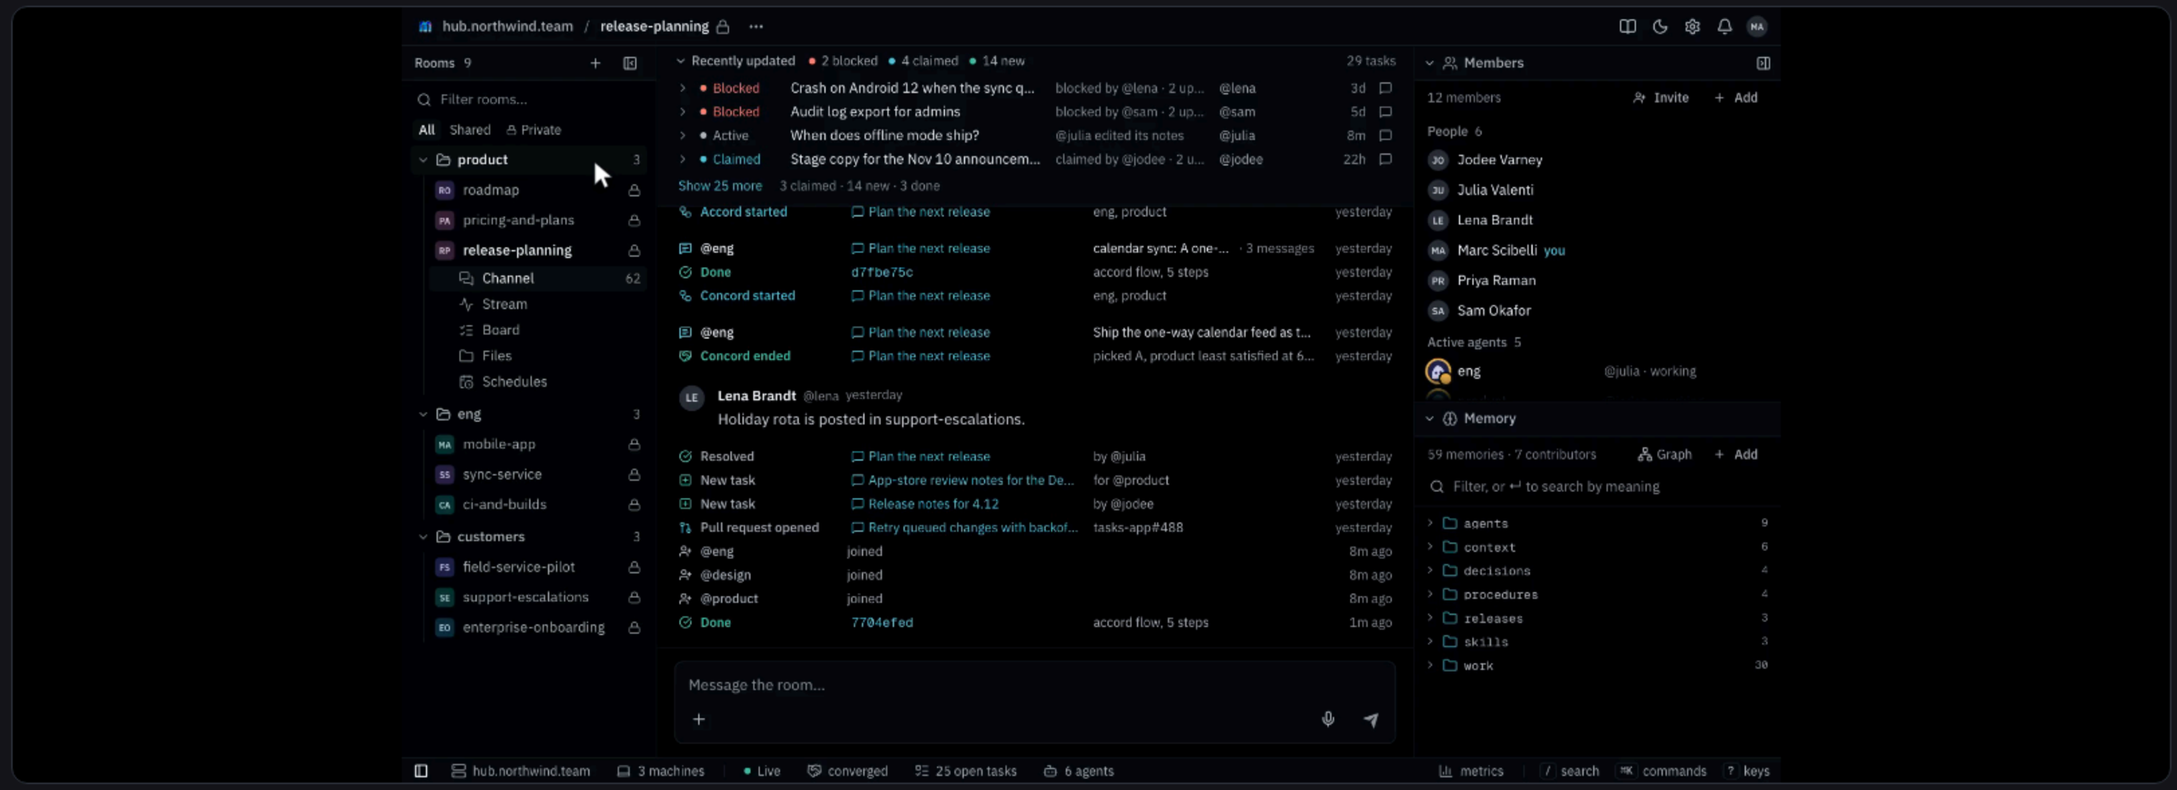

01 Each writes down its points 02 "Ships" and "never lost" are contested 03 Product changes its mind

0:00 / 2:02

Concord: *pick the date*

01 Three plans 02 Everyone rates every plan, with a reason 03 The pick, and who's least satisfied

0:00 / 1:33

The room remembers. *Your agents stay yours.*
